
C.A.W.D opening Animation.

By Connor East

I am proud of this project because I created it by myself and, it turned out to be really nice and well put together. This Animation project was about creating an animation that showed off, to the fullest extent, what we did in Computer Animation and Web Design, or CAWD for short. This included using pre-made content that we were given while also adding our own flair and or content to it. This project was supposed to be a group project which was meant to help teach people how to work as a group but, when my group decided not to do any of the work I decided to challenge myself and make a group version as well as my own version.

The objective was to make an animation that could describe to the new incoming students what CAWD is all about. In order to do this project, I used Adobe Media Encoder, Photoshop, After Effects, and Premiere Pro. I had to be versatile and be able to adapt to each program's settings and layouts. I had to have a knowledge of most shortcuts as well as being able to resize images to specific sizes. I can't think of any way to make this project better. Throughout this

project, I learned how to multitask using different programs, as well as how to append different file types into specific documented formats. I also had to learn how to change a video file format while encoding.
